CHALLENGES BECOME OPPORTUNITIES IN PALM OIL

By: Ignatius Ery Kurniawan

Palm oil exporter countries that have regulations become the challenges for Indonesian and Malaysian stakeholders as the two biggest crude palm oil producers in the world.

Palm oil exporter countries that have regulations become the challenges for Indonesian and Malaysian stakeholders as the two biggest crude palm oil producers in the world.

On the other hand, palm oil industries have big opportunities to deliver evidences to public on sustainable principles and criteria that have been running in palm oil industries including in the plantations.

To deliver answer from many challenges in the exporter countries, palm oil industries have the big chances to realize sustainable palm oil as the same norm of the related stakeholders.

Traceability from palm oil supply chain is one real evidence on sustainable palm oil production. It is one of the best and sustainable practices that has been running for long, could increase productivity from the plantation harvest.

Big chances that Indonesia has, should answer the challenges from other countries. Besides, the digitalization technology implementation that runs in traceability could be part of CPO production lately.

Besides, the stakeholders also create professional work situation, take every labor from different background, such as, gender, religion, and culture without discrimination.

Palm oil has been developing through togetherness with different colors. It

is known as inclusivity. Culture without discrimination has been developing in palm oil industries, from the plantation to the derivative industries.

The real evidence can be seen from the plantations in remote areas. They have labors from many different backgrounds.

Inclusivity has been developing in palm oil plantations. In some regions, we could visit villages (around plantations) where they were formed by the same tribes, such as, Bali village, Java village, Batak village, and so on.

These villages around palm oil plantations were established in the people's community and inherit culture and tribes of their origins until tradition and belief from the tribes themselves could last forever and develop until now. In general, they work as independent smallholders and get partnership with palm oil companies that operate mills.

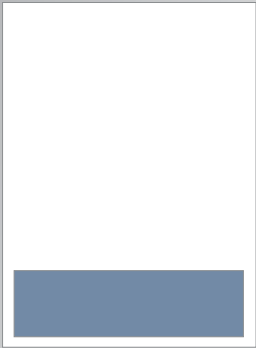

On the other hand, in the workers' housing in palm oil plantation companies, there are many tribes and religions. They are tolerating and cooperating to develop palm oil plantations of (a) company.

Inclusivity as the old development system has been developing through palm oil industrial development. The same model can be seen in CPO derivative industries in Indonesia. □
